

CHAPTER V. CONCLUSIONS AND SUGGESTIONS

A. Conclusions

Based on the results of research and discussion about the relationship between long suffering from diabetes with sexual dysfunction in women at the Baturraden II health center, the following conclusions can be drawn:

1. There is a significant relationship between the duration of diabetes and the incidence of sexual dysfunction in women.
2. Most patients with diabetes mellitus in women (75.7%) experience sexual dysfunction.
3. The duration of suffering from diabetes patients in women mostly experience erectile dysfunction ≥ 4 years.
4. The characteristic Respondent in age mostly in range 46-55 and the educational background average is elementary school

B. Research Suggestion

Based on the results of the study, suggestions are made for further research, namely:

1. For further research, it is necessary to separate respondents who have comorbidities and complications.
2. Future researchers can further develop other variables related to this study.
3. For nurses, it is hoped that they can educate patients who experience sexual dysfunction.
